                                                                                                                                  -i. TISSEE SPECIFICITY: Highly expressed in kidney, heart followed by brain, lung, liver, skeletal muscle and testis.
-i. SIMILARITY: CONTAINS 1 CARD DOWAIN.
-i. CAUTION: Supposed to contain a SH3, a PDZ and a guanylate kinase-like domain. But none of these 3 domains are detected by PROSITE,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CARA_HUMAN STANDARD; PRT; 1032 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Interaction. They both participate in a complex with MaLT1, where MALT1 binds to Bell0 (By similarity).

SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

TISSUE SPECIFICTY: Detected in adult heart, kidney and liver; lower levels in intestine, placenta, muscle and lung. Also found in fetal lung, liver and kidney.

SIMILARITY: CONTAINS I CARD DOMAIN.

CAUTION: Supposed to contain a SH3, a PDZ and a guanylate kinase-like domain. But none of these 3 domains are detected by PROSITE,

c-i- FUNCTION: Promotes apoptosis, pro-caspase-9 maturation and activation of NF-kappaB via NIK and IKK. May be an adapter protein between upstream TNFRI-TRADD-RIP complex and the downstream NIK-IKAP complex.

IKK-IKAP complex.

--- SUBGNIT: Self-associates by CARD-CARD interaction and forms a tight complex with MALTI. Interacts with other CARD-proteins such as CARD9, CARD10, CARD11 and CARD14. Binds caspase-9 with its C-terminal domain. Interacts with TRAF2 and BIRC2/C-IAP2.

--- SUBGELLULAR LOCATION: Cytoplasmic. Appears to have a perinuclear, compact and filamentous pattern of expression. Also found in the nucleus of several types of tumor cells.

--- TISSUE SPECIFICITY: Ubiquitous.

--- PTM: Phosphorylated. Phosphorylation results in dissociation from TRAF2 and binding to BIRC2/C-IAP2.

--- PTM: Phosphorylated. Phosphorylation results in dissociation from TRAF2 and binding to BIRC2/C-IAP2.

--- DISEASE: Involved in a t(1:14)(p22:q32) chromosomal translocation recurrent in low-grade MALT lymphoma (Mucosa-associated lymphoid tissue). Although the BcIllO/THH translocation leaves the coding region of BCL10 intact, frequent BCL10 mutations could be

Regulatory mechanisms of TRAF2-mediated signal transduction by BC110,
a MALT lymphoma-associated protein.
J. Biol. Chem. 275:11114-11120(2000).
I- FUNCTION: Promotes apoptosis, pro-caspase-9 maturation and
activation of NF KappaB via NIK and IKK. May be an adapter protein
between upstream TNFR1-TRADD-RIP complex and the downstream NIK-
 ABOLISHES NF-KAPPA-B ACTIVATION AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        IKK-IKAP complex (By similarity).
SUBUNTI: Self-associates by CARD-CARD interaction and interacts with other CARD-proteins such as CARD9, CARD10, CARD11 and CARD14.
Binds caspase-9 with its C-terminal domain (By similarity).
Interacts with TRAF2 and BIRC2/c-IAP2.
                                                                                                                                                                                                                                                                   Gaps

                                                                                                                                                                          Strausberg R.; Submitted (MAR-2002) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Promotes apoptosis, pro-caspase-9 maturation and activation of NF-KappaB via NIK and IKK. May be an adapter protein between upstream TNFR1-TRADD-RIP complex and the downstream NIK-
                                                                                                                                                                                                                                                                                IKK-IKAP complex (By similarity).
SUBUNIT: Self-associates by CARD-CARD interaction and interacts with other CARD-proteins such as CARD9, CARD10, CARD11 and CARD14.
Binds caspase-9 with its C-terminal domain. Interacts with TRAF2 and BIRC2/c-IAP2 (By similarity).
SUBCELLULAR LOCATION: Cytoplasmic (By similarity).
INTSSUE SPECIFICITY: Highly expressed in heart, brain, spleen, lung, liver, skeletal muscle, kidney and testis. Detected in developing brain, olfactory epithelium, tongue, whisker follicles, salivary gland, heart, lung, liver and intestinal epithelia of Prim: Phosphorylated (By similarity).

Alzheimer's disease; Parthnson's disease; inflammatory disorder; anaemia; haematological disorder; myelodysplastic syndrome; myocardial infarction; stroke; immune disorder; crohn's disease; allergic rhinitis; infection;
                                                           The present sequence is human caspase recruitment domain-14 (CARD-14). The CARD-14 gene is located on chromosome 17. The CARD-14 is used for the detection of modulators that modulates the ability of CARD-14 to bind to Bcl-10 and stimulates phosphorylation of Bcl-10 or activation of nuclear factor-kappa B (NF-kB). The CARD-14 is useful for regulating growth and cell death and useful for the treatment of cancer. It is also useful for the treatment of cancer. It is also useful for the treatment of autoimmune disorders (e.g., systemic lupus erythematosus), neurological disorders e.g., Alzheimer's and Parkinson's disease, inflammatory disorders, haematological disorders (e.g., anomenia, myelodysplastic syndromes), myocardial infarctions, strokes, immune disorders (e.g., crohn's disease, allergic rhinitis), cell signalling disorders and certain viral and bacterial infections.

systemic lupus erythematosus), neurological disorders e.g., Alzheimer's and Parkinson's disease, inflammatory disorders, haematological disorders (e.g., amemala, myelodysplastic syndromes), myocardial infarctions, strokes, immune disorders (e.g., Crohn's disease, allergic rhinitis), cell signalling disorders and certain viral and bacterial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  (CARD-14). The CARD-14 gene is located on chromosome 17. The CARD-14 is used for the detection of modulators that modulates the ability of CARD-14 to bind to Bel-10 and stimulates phosphorylation of Bel-10 or activation of nuclear factor-kappa B (NP-KB). The CARD-14 is useful for regulating growth and cell death and useful for the treatment of cancer. It is also useful for the treatment of autoimmune disorders (e.g.,
                                                                                                                                                                                                                                                                            An isolated caspase recruitment domain polypeptide useful for regulating growth and cell death and useful for the treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          222

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Domain
 The present sequence represents novel numan caspase recruitment domain, CARD-11. The polyvuclectide encoding this sequence was isolated from a human T-cell cDNA library, Also described are covel human sequences for CARD-9. CARD-10 (AAU01205). AAU01206)

covel human sequences for CARD-9. CARD-11 interact and appotosis: The sequences of the invention can be used for treating a disorder associated with abnormal levels of apoptosis by creating the expression or activity of CARD-9, CARD-10, or CARD-11.

CC frey can be used for the treatment of hyperproliferative disorders or an be used for the treatment of hyperproliferative disorders (e.g. cancer), autoimmune disorders (e.g. systemic lupus erythematosus), neurological disorders (e.g. Alzheimer's disease), inflammatory disorders (c.g. cancer), autoimmune and viral infection (e.g. HTV). The CARD polypeptide, polynucleotide and an antibody which selectively binds to cappy in screening and detection assays (e.g. chromosomal compaping, tissue typing), predictive medicine (prognostic assays, monitoring clinical trials, and therapy (treatment and prophylaxis). The CARD polypeptide may be used to screen for drugs that bind to and/or concer, modulate it. CARD sequences are potential targets for regulating contining a polynucleotide apoptosis in human disease. A host create transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ;

The present sequence represents novel human caspase recruitment domain, CARD-10. The polynucleotide encoding this sequence was isolated domain, CARD-10. The polynucleotide encoding this sequence was isolated domain, CARD-10. The polynucleotide encoding this sequences of from a human skin CDAD-11 (AAU01205, AAU01207) and rat CARD-9 (AAU01204).

CARD-9, CARD-10 and CARD-11 interact with Bcl-10 which is thought to activate nuclear factor (NF)-kappaB and apoptosis. The sequences of the invention can be used for treating a disorder associated with abnormal levels of apoptosis by modulating the expression or activity of CARD-9, CARD-10, or CARD-11. They can be used for the treatment of hyperproliferative disorders (e.g. cancer), autoimmune disorders (e.g. Alzheimer's disease), inflammatory disorders (e.g. Crohn's disease), and an antibody which selectively binds to CARD can be used in screening and an antibody which selectively binds to CARD can be used in screening cand election assays (e.g. chromosomal mapping, tissue typing), predictive medicine (prognostic assays, monitoring clinical trials, and therapy (treatment and prophylaxis). The CARD polypeptide may be used to screen for drugs that bind to and/or modulate it. CARD sequences are potential targets for requisitantial inflammation, cancer. NF kappaB signalling, stress-related response and apoptosis in human disease. A host cell containing a polynucleotide encoding CARD can be used to create transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

(I) is useful as a medicament and in the manufacture of a medicament for treating plakoglobin related diseases, such as skin carcinoma or an acantholytic disease, and to screen compounds that interfere with the interaction of the polypeptide with plakoglobin related diseases, include basal cell carcinoma, squamous cell carcinoma, extramammary Paget's disease, Naxos disease, heart diseases, skin blistering and acantholytic diseases such as subcorneal acantholysis, Grover's disease, Hailey's disease or Darier's disease, and ectodermal dysplasia/skin fragility syndrome. AAU73245-AAU7324 represent novel human plakoglobin interacting protein amino acid sequences and related sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        LMTEVRRLREARKSQLQREQQLQARGRVLEEERAGLEQRLRDQQQAQERCQRLREDWEAG 195

                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents novel rat caspase recruitment domain, CARD-9. The polynucleotide encoding this sequence was domain, CARD-9. The polynucleotide encoding this sequence was consolated from a rat neuronal CDNA library. Also described are novel human sequences for CARD-9, CARD-10 and CARD-11 (AAU01207-).

CARD-9, CARD-10 and CARD-11 interact with Bcl-10 which is thought card rector (WT)-kappaB and apoptosis. The sequences of the invention can be used for treating a disorder associated with abnormal levels of apoptosis by modulating the expression or activity of CARD-9, CARD-11. They can be used for the treatment of hyperproliferative disorders (e.g. cancer), neurological autoimmune disorders (e.g. systemic lupus erythematosus), neurological disorders (e.g. Alzheimer's disease), inflammatory disorders (e.g. Alzheimer's disease), inflammatory disorders (e.g. cancer), neurological disorders disease), and viral infection (e.g. HIV). The CARD polypeptide, crohic and an antibody which selectively binds to CARD can be used in screening and detection assays (e.g. chromosomal mapping, tissue criping), predictive medicine (prognostic assays, monitoring clinical cripins, and therapy (treatment and prophylaxis). The CARD polypeptide may be used to screen for drugs that bind to and/or modulate it. CARD sequences are potential targets for regulating inflammation, cancer, concerved the containing a polynucleotide encoding CARD can be disease. A host cell containing a polynucleotide encoding CARD can be used to create transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  8

The present sequence represents novel human caspase recruitment
domain, CARD-9. The polynucleotide encoding this sequence was isolated
from a human magakaryocyte cDNA library. Also described are novel human
sequences for CARD-10 and CARD-11 interact with Bcl-10 which is
cancer and the invention can be used for treating a disorder
cassociated with abnormal levels of apoptosis by modulating the
sequences of the invention can be used for treating a disorder
cassociated with abnormal levels of apoptosis by modulating the
expression or activity of CARD-9, CARD-10, or CARD-11. They can
be used for the treatment of hyperproliferative disorders (e.g.
cancer), autoimmune disorders (e.g. systemic lupus erythematosus),
neurological disorders (e.g. Alzheimer's disease), inflammatory disorders
(e.g. Cronn's disease), and viral infection (e.g. CARD
coplypeptide, polynucleotide and an antibody which selectively binds to
CARD can be used in screening and detection assays (e.g. chromosomal
capping, tissue typing), predictive medicine (prognostic assays).
CARD polypeptide may be used to screen for drugs that bind to and/or
computation; clinical trials, and therapy (treatment and prophylaxis). The
condition cancer, NF kappab signalling, stress related response and
apoptosis in human disease. A host cell containing a polynucleotide
encoding CARD can be used to create transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   caspase recruitment domain (CARD) proteins, CARD-9, CARD-10, 11, useful as targets for therapy, as immunogens, and in screening

Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily

Where a primer set comprises: (a) an oligo-dT primer and an Oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a
without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs.

9
polynucleotide which comprises a 3'-end sequence, where the coligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs are the full-length and AAH13628 and AAH13638 to AAH13628 to AAH13628 consequences; AAB95486 to AAH13632 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               123 EQ-SLRTASDQESGDEELNRLKEE----NEKLRSLTFSLAEK------DILEQSLDE 168

polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymerase chain reaction (PCR) primers, oligomers, and for chromosome production of (II). The polymerased genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010 ABG30377 represent novel human amino acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        14;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprises a 3'-end sequence. Or complementary to the complementary strand of a polynucleotide which comprises a 1'-end sequence. The primer sets can be used in antisense therapy and the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the cetection and/or diagnosis of the abnormality of the full-length cDNAs. The primers are also useful for the cetection and/or diagnosis of the abnormality of the full-length cDNAs. The primers are also useful for AMH13628 and AMH136131 to AAHH3612 represent human amino acid sequences; and AMH13629 to AAHH3632 represent human amino acid sequences; and AMH13632 to AAHH3632 represent human amino acid sequences; and AMH13632 to AAHH3632 represent human amino acid sequences; and the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       LQEENEKLQGRSEELERRVAQLQRQ------IEDLKGDEAKAKETLKKYEGEIRQL 186

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MIT and MT2 proteins were islated from malignant cells essentially following the method of Penman and Fey, described in US Pat. Nos. 4, g812,286 and 4,885,236. DNA sequences encoding these proteins were cloned by probing expression libraries using monoclonal antibodies raised against the isolated INM proteins. The genetic sequence encoding MT2 has been disclosed by Yang et al. 1992, J. Cell Biol. 16:1395-1408, and is referred to by them as 'NuMA'. The nucleotide sequence encoding MT1 has not beed described previously. Both the MT1 and MT2 proteins are distributed throughout the nucleus (with the exception of the nucleolus) in non-mitotic cells, and localise to the spindle during mitosis. A binding protein having a binding affinity of greater than about 10(9) M(-1) for AAR47173 is claimed for use in the manufacture of a medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    471

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to methods of distinguishing malignant or growth arrested malignant cells from proliferating non-malignant cells by staining specifically Nuclear Mitotic Apparatus (NUMA) protein in a sample of intact mammalian cells and imaging the cells to determine the three-dimensional pattern of labeled NUMA protein within nucleic of the cells. The method is useful for distinguishing malignant or growth arrested malignant cells from proliferating non-malignant cells. Lumors cells and different stages in the tumor progression and different stages in the tumor progression and differentiation processes. NUMA proteins may be used to identify functional proteins or drugs to specific locations inside the cells. The present sequence represents the human NUMA protein (GenBank Accession
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          NuMA; Nuclear Mitotic Apparatus protein; malignant; cell growth; human; tumor progression; structural protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Distinguishing growth arrested malignant cells from proliferating non-malignant cells, comprises staining the nuclear mitotic apparatus protein in intact mammalian cells and determining the 3-dimensional pattern of the labeled protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            --LHYSNALQEKELAASRCRSLQEELYL----- 103

                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and antagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the nucleic acids encoding the polypeptides and cells genetically chip proteins are useful in genetic vaccination, testing and the proteins are useful in genetic vaccination, testing and therapy, and can be used as nutritional supplements. They may be used to increase stem cell proliferation; to regulate haematopoiesis; and in bond, cartillage, tendon and/or nerve tissue growth or regeneration; immune suppression and/or stimulation; as anti-inflammatory agents; and in treatment of leukaemias. AAU29510-AAU33304 represent the amino acid sequences of novel human secreted proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acids encoding a range of human polypeptides, useful in genetic vaccination, testing and therapy -

The sequences given in AAW21731-32 represent fusion proteins which contain NuMA (nuclear mitotic apparatus). The fusion proteins were used in the identification of NuMA interacting proteins (NIP's) (see also AAW21729-30). Compounds which interfere with the interaction of NuMA proliferation. Ab. raised conventionally using NIP-1 or -2 as immunogen, are used to detect NIP (or their complexes) and to block their activity for diagnostic or therapeutic use, e.g. to detect defective NuMA or NIP (which may be markers for aberrant (including malignant) cell growth (which can also be detected by nucleic acid sequencing). Also where malignancy is related to defects in NUMA or NIP, it can be treated by andistration of the appropriate functional protein.
proteins - useful for modulating cell division and proliferation and
